## Notes:

How to use the T/W column. If your screen size does not appear on this chart, use the T/W column to find the lens you need.
Divide the Throw distance by the screen Width to get your "target T/W number". Then, look for a lens with a T/W range that covers it.
Understanding Lens Shift. The number in the Shift column expresses the projector's position relative to the image height. $50 \%$ positions the projector's lens perpendicular to the center of the image (on axis). $100 \%$ up positions the projector's lens perpendicular to the bottom edge of the image. $114.3 \%, 103.3 \%$ and $110.5 \%$ up positions the projector's lens perpendicular to a point $14.3 \%, 3.3 \%$ or $10.9 \%$ of the image height respectively, below the image.

These charts are a simulation. Effective Focal Length (EFL) most accurately represents lens behavior, and drives the calculations..
Calculations are from the front glass of the lens and accurate to approximately $+/-3 . \%$. Specifications are subject to change without notice.
