## 1. Overview

- 1.1 This Functional Specification defines communication functions for LC-XB41N.
- 1.2 Compatible to Firmware Ver. 1.x of the projector.
- 1.3 Most commands can be used to control projector remotely from PC by RS-232C. Therefore, the commands are defined as Expand Serial Commands.

## 2. Serial Interface Specification

### 2.1 Transfer Specification

Item	Specification
Synchronous System	Asynchronous
Transmission Speed	9600 / 19200
Data Length	8 bit
Parity	N/A
Stop Bit	1
Flow Control	N/A

Note1) Transmission Speed : initial setting value is 19200

Note2) Transmission Speed can be changed in service mode.

### 2.2 Connection

Dedicated serial cable must be used for a connection to a computer and a projector.

### 3. Notes for communication

3.1 Expand Serial Command is defined as one command / one line that starts with "C" and ends with carriage return (0x0D)

3.2 There are two types of commands: Functional Execution Command and Status Read Command.

- Example of Functional Execution Command: "CF\_BRIGHT\_032"[CR]

- Example of Status Read Command: "CR\_RIGHT"[CR]

- Example of Control Switch Command: "PF\_LANMODE\_1"[CR]

Note) " \_ " means a space

3.3 When it takes more than one second to receive one command, it is not executed.

When it takes more than one second to receive carriage return (0x0D) after the projector receives the first data "C", it clears the information of buffer.

3.4 On command pipelining, wait for the interval of 100ms till sending next command after receiving a response.

3.4.1 When a computer sends next command before receiving a response, the projector may not operate properly.

3.4.2 Except when there is no response for more than 5 seconds.

3.5 It takes about 5 seconds for internal initialization after plugging in AC power. During this time commands cannot be processed. Do not issue any command.

### 4. Name Definition

4.1 Data from a controller to a projector is represented as COMMAND, and data from a projector to a controller for the incoming command is represented as RESPONSE.

4.2 [CR] : Carriage Return Code

Command ends with carriage return code.

Response also ends with carriage return code.

4.3 \_ : Space Code

All space Code is indicated by (\_).

4.4 %1 : Parameter in Command

When there are some parameters, they are defined as %2, %3...

4.5 %%% : Error code returned from a projector

Acceptable: "000".

Unacceptable: See [7. Error Code Table].

4.6 %a : Parameter in Response Command

When there are some parameters, they are defined as %b, %c...

Response	Acceptable	"000_%a_%b_%c"[CR]
	%a %b %c	%a ----- Sensor 1 status %b ----- Sensor 2 status %c ----- Sensor 3 status  "W" ---- Approach or reach abnormal temperature (dangerous temperature) "S" ---- Far from abnormal temperature (safe temperature) "N" ---- Sensor detects no abnormal temperature  [Example] "S_W_S"[CR] means Sensor 1 detects safe temperature, Sensor 2 detects abnormal temperature and Sensor 3 detects safe temperature Note) When the temperature difference between Sensor 1 and 3 reaches specific value, it is considered as temperature abnormality by the projector model. In this case, the 3rd data means if the temperature difference between Sensor 1 and 3 is dangerous state or not. The 3rd data means temperature abnormality due to Sensor 3 When abnormal temperature is not detected by sensor, "N" (No connection with temperature abnormality) is returned.

### 9.12.6 CR\_TEMPFAIL Command

Command	"CR_TEMPFAIL"[CR]	
Details	Get the temperature inside a projector when abnormal temperature occurs. It is possible to get the temperatures all at once with some sensors installed.	
Response	Acceptable	<p>"000_%a_%b_%c"[CR]</p> <p>%a ----- Sensor 1 temp. (External temp.)                  %b ----- Sensor 2 temp. (Internal temp.1)                  %c ----- Sensor 3 temp. (Internal temp.2)</p> <p>[Example]                  "_31.5F"[CR]                  "_" indicates a space. When the temperature sinks to -, the first character is "-" like "-05.5F"[CR]                  The last character means the sensor's status if it reaches abnormal temperature</p> <p>Exceeding critical temp. ----- "F"                  Temp. is safe ----- "S"                  Sensor detects no critical temp.----- "N"</p> <p>The example shows that sensor 1 indicates 31.5 degrees and the temperature is abnormal.                  When the temperature is safe, all data are represented as "□000S".                  When the projector is reset, "□000S" is set, and every time abnormal temperature occurs, it renews the data and returns it.                  In short, it only returns the renewed data of the latest abnormal temperature and the previous data is deleted.</p>
