# LSE Controls, Llc. – Audio Module

The Audio Module works in concert with EZtrol, either the Standard (EZ-100) or the Executive (EZ-300) model, to control volume levels to an external audio system.  The audio module provides an easy method of interface for installations where the sound produced by the data projector's speakers are not adequate for the venue, or where there is an amplification system already in place.

The Audio Module was created to allow EZtrol to provide a single device for room users to deal-with, while controlling sound levels for four source devices, through whatever sound system may already be in place.  This is a low cost method to overcome constant line volume out limitations or to interface with previous equipment incarnations.
